FAQ

Q1: What programming languages are commonly used in CSS research?

A1: Python is the most prevalent language due to its rich ecosystem of libraries (like NetworkX for SNA, Scikit-learn for machine learning, and NLTK for NLP). R is also widely used, particularly for statistical analysis and data visualization. Other languages like Java and C++ are utilized for specific tasks requiring high performance.

Q2: What are some ethical considerations in CSS research?

A2: Ethical considerations are paramount. Researchers must be mindful of data privacy, algorithmic bias, and the potential for misuse of findings. Informed consent, data anonymization, and transparency in methodology are crucial. The potential for reinforcing existing social inequalities through biased algorithms needs careful consideration.

Q3: How can I get started learning about CSS?
