FAQ

Q1: What types of microscopes would have been used in 1887 for histological studies?

A1: In 1887, light microscopes were the primary tool. These would have been compound microscopes using visible light,

offering limited resolution compared to modern microscopes. Advancements in lens design and illumination techniques were ongoing, constantly improving image quality, but still far from the capabilities of today's electron microscopes.

Q2: What were the main staining techniques utilized in 1887 histology?

A2: Hematoxylin and eosin (H&E) staining was already established and widely used. This combination stains cell nuclei purple (hematoxylin) and cytoplasm pink (eosin), enabling visualization of basic tissue architecture. Other stains, perhaps less common, would likely have been experimented with, but their reliability and consistency would have been variable.
