FAQ

Q1: What is the difference between geostationary and LEO satellites?

A1: Geostationary satellites orbit the Earth at the same speed as the Earth's rotation, appearing stationary from the ground. This provides continuous coverage but requires a high altitude. LEO satellites orbit at lower altitudes, offering lower latency but requiring more satellites for global coverage. A satellite communications handbook will delve into the trade-offs between these different orbital types.

Q2: How does a satellite link budget work?

A2: A satellite link budget meticulously accounts for all signal gains and losses throughout the transmission path. This includes the transmit power, antenna gains, atmospheric attenuation, path losses, and receiver noise. The goal is to ensure sufficient signal strength at the receiver to overcome noise and guarantee reliable communication. A handbook will provide the formulas and methodologies for performing this crucial calculation.

Q3: What are the challenges of operating satellite constellations?
