Frequently Asked Questions (FAQ)

Q1: What is the difference between intraoral and extraoral radiographs?

A1: Intraoral radiographs are taken inside the mouth, providing detailed images of individual teeth and surrounding structures. Extraoral radiographs, such as panoramic and cephalometric radiographs, are taken outside the mouth, providing a wider view of the jaws and surrounding tissues. The choice between them depends on the diagnostic needs.

Q2: How often should patients have dental X-rays?

A2: The frequency of dental X-rays varies depending on individual patient needs and risk factors. Regular checkups with a dentist are crucial for determining the appropriate frequency. Some patients may need X-rays annually, while others may require them less frequently.

Q3: What are the risks associated with dental X-rays?

A3: The amount of radiation exposure from dental X-rays is generally low. Modern digital radiography significantly reduces radiation exposure compared to traditional film-based methods. However, minimizing radiation exposure through proper techniques and shielding remains crucial.

Q4: What is cone-beam computed tomography (CBCT) used for in dentistry?

A4: CBCT provides three-dimensional images of the jaws and surrounding structures. Its applications include implant planning, endodontic procedures, the assessment of impacted teeth, and the diagnosis of complex pathologies. It offers significantly enhanced detail compared to traditional radiography.
