# Understanding the Role of the Water Pump Housing O-Ring

The water pump, a vital part of your Acura RSX's cooling system, circulates coolant throughout the engine to prevent overheating. The water pump housing o-ring seals the connection between the water pump and its housing, preventing coolant leaks. A faulty or damaged o-ring leads to coolant leaks, ultimately resulting in overheating and potential engine damage. This is why regular inspection and, if necessary, replacement, are so important. Ignoring a leaking o-ring can lead to costly repairs down the line, including a complete water pump replacement or even engine rebuild. Therefore, understanding the function and maintenance of this **Acura RSX water pump gasket** and related seals is paramount.

## Identifying a Faulty O-Ring: Signs and Symptoms

Several telltale signs indicate a problem with your 2003 Acura RSX water pump housing o-ring. These include:

- **Visible coolant leaks:** Look for greenish or orange coolant around the water pump housing.
- **Low coolant levels:** Regularly check your coolant reservoir. Consistent drops in coolant levels, even without visible leaks, could point to a leak from the o-ring.
- **Overheating:** If your engine consistently overheats, even with sufficient coolant, a leak from the o-ring could be the culprit. This is a serious issue and requires immediate attention.
- **White smoke from the exhaust:** In severe cases, a significant coolant leak can lead to white smoke emanating from your exhaust pipe.
