Interaction of Radiation with Matter: A Microscopic Perspective

This section delves into the fundamental processes governing how ionizing radiation interacts with matter at the atomic and molecular levels. The book meticulously explains various interaction mechanisms, including:

- **Photoelectric effect:** The complete absorption of a photon by an atom, resulting in the ejection of an electron. This effect is energy-dependent, being more prevalent at lower energies.
- **Compton scattering:** The inelastic scattering of a photon by a free electron, resulting in a reduction in photon energy and a change in direction. This is a dominant interaction mechanism at intermediate energies.
- **Pair production:** The creation of an electron-positron pair from a high-energy photon interacting with the nucleus of an atom. This process only occurs at energies above 1.02 MeV.

Understanding these interactions is vital for designing effective radiation shielding, optimizing imaging techniques, and predicting radiation dose. The text uses clear diagrams and illustrative examples to make these complex concepts readily comprehensible.
